Analyzing Data for School District Improvement

or…Dancing the 'Texas Twenty-Two-Step'

Professor Strabismus University of Mars

2024-02-05

> **"My aim here is to contribute something to the improvement of learning in our school district; or any school district. My basic supposition is that school boards and administrators will welcome information designed to help them create rational policy action aimed at improving future learning in their district."**
>
> Professor Strabismus
> *University of Mars*

This paper is for those striving to improve the system of learning in their school district. It is directed toward school boards and superintendents, but anyone can use the theory and techniques to improve their teaching, classrooms, campuses, or departments. All that is needed is an open mind, willingness to do things a little differently, and a sense of urgency for getting things done. That sounds like Texans, to me.

BACKGROUND

Everyone connected to a school district seeks information that answers the questions: "How are we doing?", "Is this a one-off, or an actual pattern?" and "Are we improving?" Currently, there are dozens of situations where we seek answers to questions like this, but none of the reports we see can answer such questions. We are left only with intuition and subject-matter experience to guide our actions on policy, performance, and pedagogy.

Table 1: Here are a just a few examples where we seek those answers, but find none:

Evaluation Metric	Evaluation Metric
STAAR scores	Survey results
District improvement plans	TAPR reports
Dropout rates	Pedagogy review
On-time arrival for buses	Attendance rates
Superintendent evaluations	Graduation rates
Superintendent searches	Accountability ratings

As it turns out, there is a very simple solution - **IF** we can get our data into the right form for reporting. To be able to answer questions like these our reports must come to us in a different format. They must contain the context of time, in the form of plotting the results time-period-by-time-period (the more time periods presented the better). A very simple analysis showing what we can rationally expect in the future should accompany the presentation of the results.

Neither the Texas Education Agency (TEA) nor the Texas Association of School Boards (TASB) have helped us with this particular problem.

WHAT WE ARE GETTING NOW

All school boards and superintendents work hard to 'keep the lights on' and improve learning in their districts and campuses (or 'campi' if you prefer the Latin form, because it ***is*** funnier).

For example, most school boards and superintendents understand from experience and training that it is learning that they hope to improve, not standardized scores. We know by now that standardized scores can increase while the quality of learning actually decreases. Despite that knowledge it is often quite difficult to resist reacting to any differences in results as if they constitute a 'trend' or a 'signal'. Ratings and rankings of our districts and schools by the Texas Education Agency (TEA), under the auspices of the state legislature (or anyone else for that matter), is no different.

The TEA collects data from every school in Texas, performs various calculations, and produces reams of reports and tables summarizing their results by academic year. These reports consist primarily of calculations mandated

by the state legislature, including those designed to allow districts to fulfill their public notification requirements.

These statistical summaries are available to the public and the school districts. Unfortunately for the public and the school districts, the information is not nearly as helpful as it could be. In fact, it takes so much 'data wrangling' to put it into a form that is remotely helpful for assessing and improving district and campus learning that it is simply not done.

Instead, administrators and school boards stare at endless rows and columns of mind-numbing data fragments that are 'sliced and diced' to an extent that even RonPopeil the inventor of the Chop-O-Matic would be envious!

Here's a partial example from a TEA report called a 'Snapshot':

STAAR by Subject

Percent of Tests	All Subjects	ELA Reading	Mathematics	Science	Social Studies
At Approaches Grade Level Standard or Above	80%	79%	78%	84%	85%
At Meets Grade Level Standard or Above	53%	55%	48%	58%	60%
At Masters Grade Level Standard	25%	23%	21%	29%	39%

Figure 1: Small sample from TEAs Snapshot report

The entire report can be found here:

OBSTACLES TO IMPROVEMENT

So, what is a school district to make of these mountains of aggregated numbers? Do they help districts improve learning in the future? In their present form, the answer is a resounding "NO!"

OBSTACLE #1

When it comes to improving the system of education in a district this view of the data has several big problems. One is aggregation. The TEA reports aggregate more than one rating level into a single level. It combines the 'At Approaches' AND the 'At Meets' AND the 'At Masters' rating levels all into one combined total and calls it "At Approaches AND HIGHER Level".

To make that category useful for improvement efforts we have to break it into three separate levels, so each represents a single situation. That turns out to be quite tedious and time-consuming. Just for fun, I call this situation 'dancing the Texas Twenty-Two-Step' - because it will take at least twenty-two additional steps to make the measurements useful!

The 'Snapshot' report offered by the TEA is a good example. My hat is off to their programmers. It is an impressive compilation of statistics all in one place. It is well-suited for the needs of the TEA and their reporting responsibilities to the legislature; but completely ill-suited for helping the concerned school board, superintendent, or even tax-paying citizen make an analysis aimed at improving future learning. One might call it a triumph of computation over value.

Although this aggregation permits TEA to render abstract judgments about a district or campus, the lack of specificity renders these reports unsuitable for understanding any particular categories or levels your board may be interested in monitoring or improving.

By analogy, it is like trying to repair your car by reading the overall repair records of similar models. What you need is diagnostic data about what is happening (or not happening) with your specific vehicle.

Here is an example of aggregated STAAR categories in a TEA report:

STAAR by Subject

Percent of Tests	All Subjects	ELA Reading	Writing	Mathematics	Science	Social Studies
At Approaches Grade Level Standard or Above	78%	77%	63%	79%	83%	87%
At Meets Grade Level Standard or Above	52%	52%	30%	50%	60%	65%
At Masters Grade Level Standard	23%	20%	6%	23%	31%	43%

Figure 3: The first two rows contain more than one achievement level

OBSTACLE #2

These reports are 'ill-suited' for district improvement efforts for another reason: the TEA reports are **siloed by academic year**, making it nearly impossible to create a time-period-by-time-period data frame of any categories or levels the board may wish to analyze. In fact, without time-period-by-time-period data ***no meaningful analysis is possible.***

OBSTACLE #3

> **"At sea one day you will smell land where there be no land."**
> - Elijah, to Ishmael and Queequeg
> *Moby Dick (1956)*

Obstacle number 3 is not related to the TEA reports at all. It has to do with how we humans are (or, as Jessica Rabbit put it: "I'm not really like that; it's how I was drawn!").

For survival, humans evolved with the ability to rapidly detect patterns. That instinct can lead us astray when studying our data. Unfortunately, we quite naturally see 'trends' and 'signals' where there are none. Analysis was developed to help separate the actual signals in the data from the random fluctuations that are always present in any measurement.

Consider that for any three measurements there are at least 10 completely random arrangements that can arise. And, we have created names for these completely artificial 'trends' that we think we see:

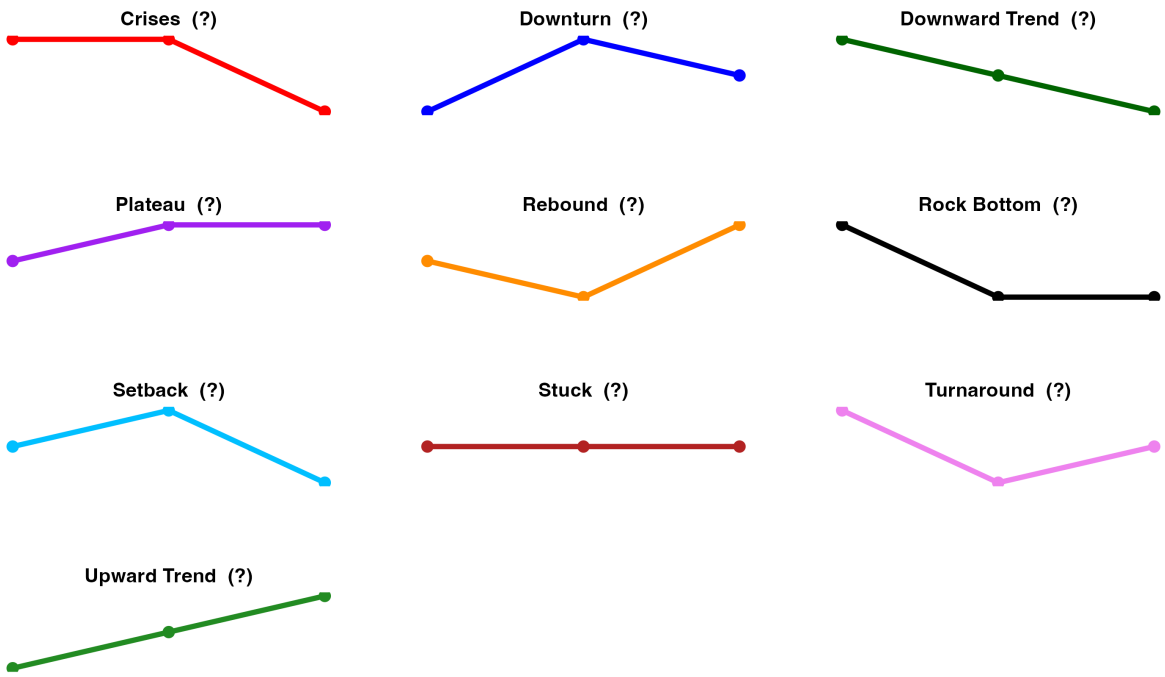

Figure 4: Ten random arrangements of 3 measurements

How many of those 'trends' do you see on this example of TEA data placed on a bar chart?

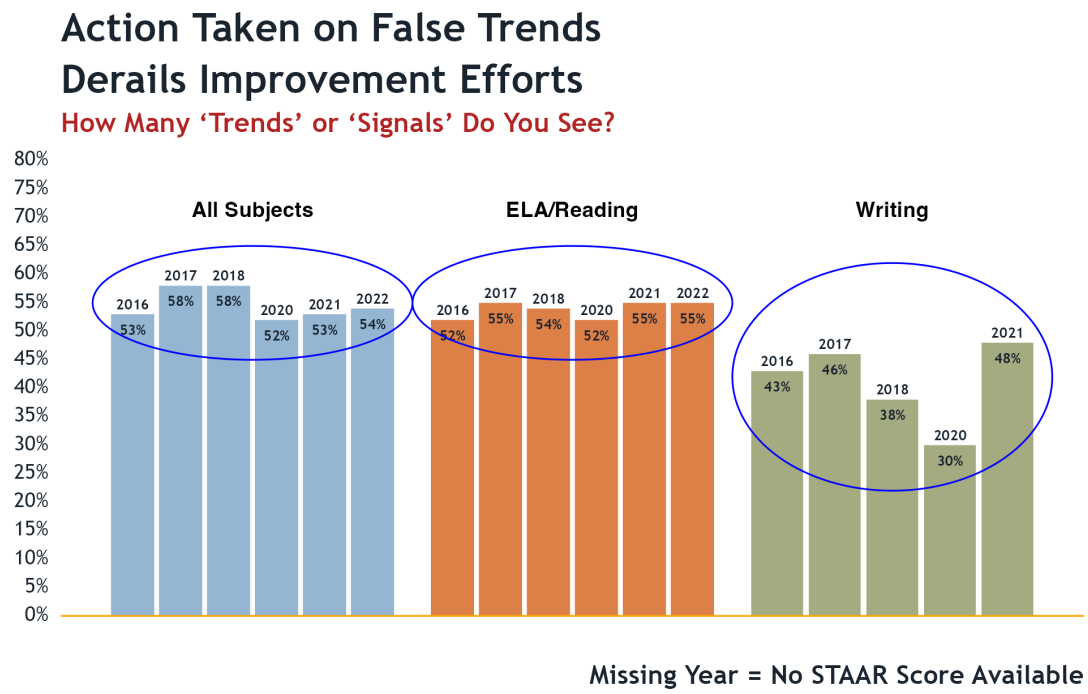

Figure 5: Do you see any trends or signals?

ANALYSIS - WHAT IS IT?

In this context analysis means to subject the data to ONE very simple statistical test to see if the system (or process) producing the data shows evidence of being in a ***stable state***, with a ***predictable capability***.

If stable, this capability will show a range of values that constitute 'normal' for the process. Until the process itself changes in some fundamental way future measurements will wander between the capability limits; sometimes upward, sometimes downward, sometimes the same.

Let's look at an example. A visual is always better than mere words.

GETTING BLOOD FROM THE TURNIP

After an embarrassing amount of time spent 'data wrangling' I was able to construct from the 5 available TEA 'Snapshot' reports a small time-period-by-time-period data frame for STAAR scores for all subject-matter categories

at the district-level for the academic years ended 2016-2022. (No STAAR scores were available for the 2019 academic year.)

The TEA STARR Data Divided Into Constituent Parts for the subject 'Math'

Table 2: Subject = Math, with Proportions Broken Into Constituent Parts.

Year	Approaches	Mts Std	Masters	Combined	Failing
2016	31%	29%	24%	84%	16%
2017	27%	31%	30%	88%	12%
2018	25%	29%	33%	87%	13%
2020	29%	27%	23%	79%	21%
2021	30%	27%	21%	78%	22%
2022	31%	31%	18%	80%	20%

An amazing amount of information is now available to us using just this small data frame.

Here is an example of what an actual analysis of STAAR data looks like:

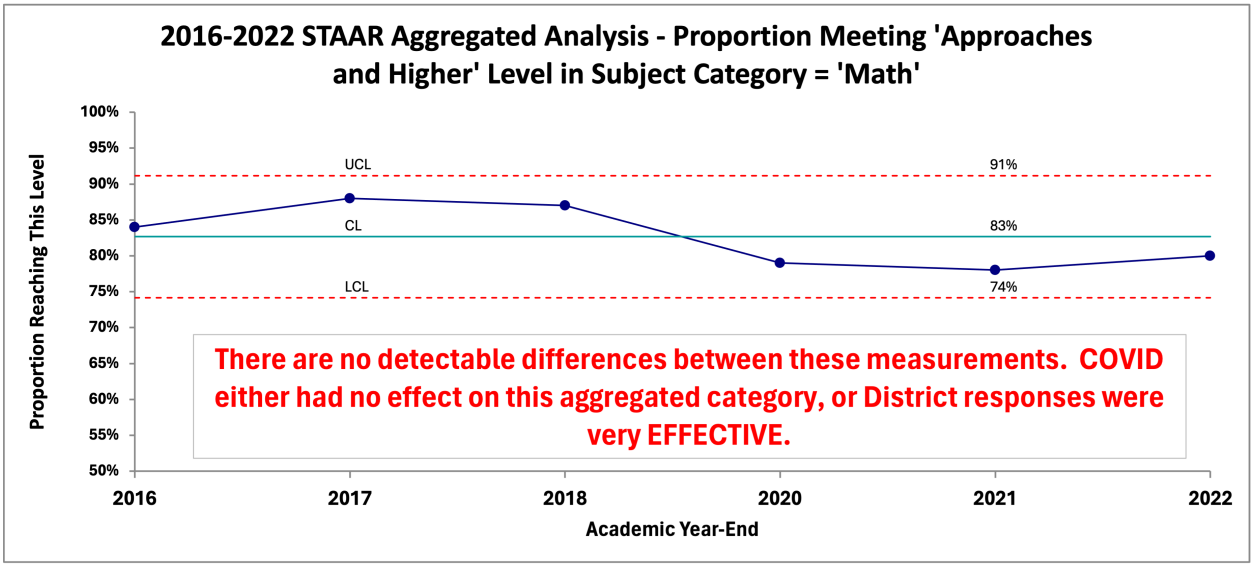

Figure 6: This presentation contains all the information the data can reveal

INTERPRETING THE CHART

- In this case, the chart shows that all measurements fall between the calculated Upper Limit (UCL) and Lower Limit (LCL), with no statistical trends identified. Accordingly, the process is ***stable***, with a ***predictable capability***. Of the many forces influencing the results, no one of them is predominant. If one (or a combination) was predominate the chart would reveal it.
- If the process remains fundamentally the same, **the proportion of students in the district taking the STAAR exam in Math that reach the level of 'Meets Approaches Standard, or Higher' will continue to fluctuate between 91% and 74%, with an average proportion of 81% (the CL)**.
- Any expectation of results outside those limits, without a significant change to the system, would not be justified - at all.
- This one chart contains all the information this data can reveal. If you need or want more information you have to collect more data.

For those thinking about the additional work needed to provide an anlysis when reporting data to the board, or to the public, know that once the data was wrangled, ***it took less than 5 minutes to create the chart*** using a very inexpensive Excel add-in!

Another Note: Even the extreme government measures imposed during the COVID-19 pandemic apparently were not disruptive enough to the district to create even a single point outside the natural limits. Or, the counter-measures employed by the district were very effective.

Technical Note For the Statistically Curious: The calculated limits are NOT set at 3 standard deviations above and below the average. The various statistical tests you learned in Statistics 101 cannot help you when your attention is focused on the future output of your district, campus, or pedagogy. They were designed to characterize a population as it exists at a single moment in time - how much or how many; without regard to why the population came to be the way that it is. Even the forecasting techniques are inappropriate for the task at hand.

The reaction of management (which includes the school board) should be completely different if the system or process indicates a stable state (predictable) than when it shows signals of being unstable (statistically speaking, of course).

Reacting to so-called performance indicators that fall within the 'normal' range of a predictable process is ***harmful.*** It makes things ***worse***; no matter how emotional you may become if you think you see things 'going in the wrong direction.'

Reacting to indicators falling outside the identified 'normal' range is ***productive***. If the indicator is in the 'good' direction efforts to identify the causes and duplicate them are almost always successful. If they fall in the 'bad' direction, efforts to identify the causes and remove them are worthwhile.

All data I've seen so far as a board member are descriptive only, with no analysis present. The most important step, analysis, is missing.

A SOLUTION

To improve we must move from a 'snapshot' point of view to an 'analysis' point of view. ***There is no in-between.*** That means the data we seek must include the context of time. All improvement work requires time-period-by-time-period data.

The crucial information for analysis of process and district capability (and the prediction of future performance) is contained in the order of occurrence found in the time-period-by-time-period data. ***The more periods included***

in the analysis, the stronger the evidence for your inferences from the charts.

Humans naturally seek context. That is where notions such as 'this month vs last month vs YTD vs a year ago this month' arose. Those are insufficient for analysis, but they soothe our need for context of some sort.

Adding analysis to our efforts allows us to answer the big, important questions:

- These numbers vary from period to period. **Does that tell us anything important?**
- Are the differences due to normal **random fluctuations** or some strong influence now present in our system?
- Do these different numbers **constitute a trend** (good, or bad)?
- The legislature (via the TEA) declares that certain average STAAR scores 'meet requirements.' What is the **demonstrated** capability of our district to deliver those STAAR scores? In other words, what is rational to expect from our system **in the future?**
- **Should we continue** this approach, **abandon** it, or **continue it with some tweaks?** Like all bureaucracies, school districts often find that practices, policies and procedures are seldom abandoned. They just become 'the way we do it here.'

Managing a district consists of budgeting, administration, and resource allocation. Essential, to be sure.

Budgeting is based on (hopefully) very careful calculations of estimated revenue and expenses expected for the next academic year. Resource allocation within and between budget categories are determined by the priorities and risk tolerance of the Board of Trustees.

Resources for facility expansion and improvement depend on both the demographics of the district and the vision of the Executive team.

District improvement is a totally different exercise. To improve, boards must be able to assess the demonstrated capability and effectiveness of learning in their district. .

The context of **TIME** is crucial to assess the capability and effectiveness

of any system or process, including learning.

Nearly every district has a 'reputation' (for better or worse) in the region, state, or nation. Some districts have reputations for great athletic programs, some for music/arts, some for academics. Those reputations are built over time.

STAAR scoring by subject matter (from the 2022-2023 Snapshot) To view entire report from pdf format click here: pdf To view entire report from html format click here:

STAAR by Subject

Percent of Tests	All Subjects	ELA Reading	Writing	Mathematics	Science	Social Studies
At Approaches Grade Level Standard or Above	78%	77%	63%	79%	83%	87%
At Meets Grade Level Standard or Above	52%	52%	30%	50%	60%	65%
At Masters Grade Level Standard	23%	20%	6%	23%	31%	43%

Figure 7: This is a caption for the image.

The section reporting STAAR scoring by ethnicity:

STAAR by Ethnicity

Percent of Tests	African American	Hispanic	White	American Indian	Asian	Pacific Islander	Two or More Races	Economically Disadvantaged
At Approaches Grade Level Standard or Above	75%	75%	83%	80%	88%	81%	82%	67%
At Meets Grade Level Standard or Above	46%	46%	60%	46%	68%	51%	56%	37%
At Masters Grade Level Standard	18%	20%	29%	26%	34%	16%	25%	15%

Figure 8: This is a caption for the image.

School boards deal with two types data:

- Enumerative: quantitative information limited to a description of the past, usually for compliance purposes.
- Analytic: data subjected to analysis for estimating a causal explanation of phenomena observed in the past, with the aim of improvement in the future.

The aim of a TEA report is descriptive. How many or how much. They are estimates of how many people belong to this or that category for a specified academic year. Or, to report the financial aspects of operations during the school year. Their aim is NOT to find out WHY there are so many or so few in this or that category: merely how many.

School boards should look to take action on the district-level processes, or cause-system, that produced the data described in the TEA reports, the aim being to improve learning in the future. Interest centers on future learning, not the learning of the past. For example : adopt Policy B over A, or hold on to Policy A, or continue the study of Policy B.

Enumerative study: A statistical study in which action will be taken on the material in the frame being studied.

Analytic study: A statistical study in which action will be taken on the

process or cause-system that produced the frame being studied. The aim being to improve practice in the future.

In other words, an enumerative study is a statistical study in which the focus is on judgment of results, and an analytic study is one in which the focus is on improvement of the process or system which created the results being evaluated and which will continue creating results in the future. A statistical study can be enumerative or analytic, but it cannot be both.

Statistical theory in enumerative studies is used to describe the precision of estimates and the validity of hypotheses for the population studied. In analytical studies, the standard error of a statistic does not address the most important source of uncertainty, namely, the change in study conditions in the future.

Deming's philosophy is that management should be analytic instead of enumerative. In other words, management should focus on improvement of processes for the future instead of on judgment of current results.

That 27% must in part depend on chance. If we imagine a set of constant conditions, Statistics and Reality (draft) Page 2 Nov 21, 1998 which would lead on average to 100 murders, we can, on the simplest mathematical model, expect the number we actually see to be anything between 70 and 130.

If there were 130 murders one year, and 70 the next, many people would think that there had been a great improvement: but this could be just chance. So the first question we could ask is, "Could the 27% reduction be due to chance?"

That is the least of our problems. The murders may be related, as in a war between drug barons. If so, the model is wrong, since it assumes that murders are independent. Or the methods of counting might have changed from one year to the next (are you counting all suspicious deaths, or only cases solved?). Without knowing about such things we cannot predict from these figures to what will happen next year. So if we want to draw the conclusion that the 27% reduction is a "real" one, that is, one which will continue in the future, we must use knowledge about the problem that is not given by those figures alone. Even less can we predict accurately what would happen in a different city, or a different country. The causes of crime, or the effect of a change in policing methods, may be completely different.

Then your actions on the basis of the information available become much more effective. Even more, your actions to get more information improve, because when you understand the sources of uncertainty, you understand how to reduce it.

It seems that it might help if we could look at, say, six years of the 'All Subjects' category at one time.

Well, here it is:

Well, there's nothing for it but to get to work. Here they are,

See Fig. 1

If we try to look at the data over the last 6 years we still have the problem of the 'TEA Twenty-Two Step'!

As a board, we should focus first on the combined results of all subjects tested. This, purportedly, is the performance of the district taken as a whole:

The next rating category also contains more than one rating level. It combines the 'At Meets' AND the 'At Masters' into one combined total.

This rating category is the exception; it contains only one rating level. It shows ONLY the 'At Masters' level totals.

WHY MORE THAN 3 TIME PERIODS ARE NEEDED

Here we see a comprehensive view of all subject categories for the compound level of achievement called 'Meets Grade Level Standard **AND ABOVE**' for all years in the sample:

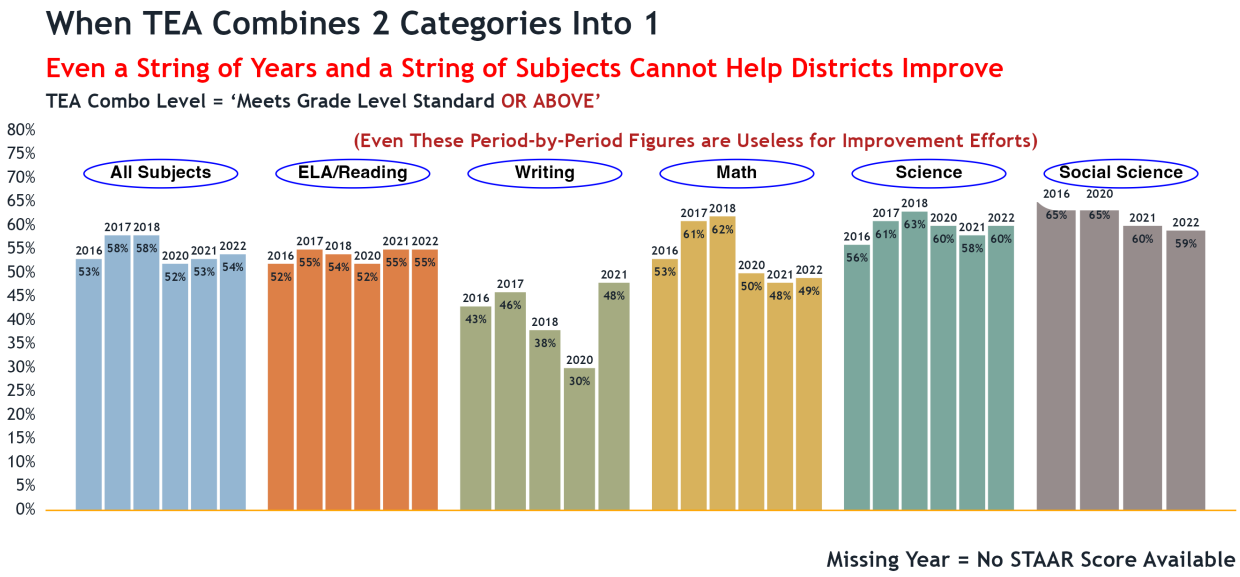

Figure 9: IS THIS A BUSY GRAPH, OR WHAT!? Still, take a moment to read it.

Interest is focused on ***the system (or process) that will produce the future output***; not the output of the past.
